

Git – Extra Tools

Mergetools

- There are external tools to help with merge conflicts
- For example: meld
 - `git config --global merge.tool meld`
 - `git config --global mergetool.keepBackup false`
- After encountering a conflict with `git merge`, run `git merge tool`
- Still need to add and commit files afterward

Stashing Changes

- what if you have changes you want to maybe keep, but you don't want to commit? git stash!
- git stash - saves both staged and unstaged changes and saves them for later
 - Add a -u to store untracked files, too!
- git stash pop
 - bring back changes
- There are more advanced features if you're interested!

Reverting Changes

- my group partner pushed an awful commit but you said not to rewrite history. What do i do?
- `git revert commit`
- This does not rewrite history, it adds new history that reverses the mentioned commit
 - this is much better for syncing with other people

View Previous States

- I want to look at an old version of a file (but not bring back that old version):
 - `git show commit:filepath`
- I want to bring back a previous version of a file:
 - `git restore --source=<commit/branch> filepath`
 - Old way
 - `git checkout commit filepath`
- Be careful, checking out just a commit will detach HEAD
