C – Type Print

Data Types:

- Non-floating point
  - int - at least 16 bits
  - long - at least 32 bits
  - long long - at least 64
- Floating point
  - float - typically 32 bits
  - double - typically 64 bits
- Character
  - char

Printing Output

- printf(controlstring [, data])
- controlstring indicates surrounding text to print, how to format variable printing
- data is optional - used when you want to print value of variable
  - says what variable to print
  - controlstring contains format specifiers for each data being printed

Format Specifiers

- integer: %d (may also see %i)
  - can add additional formatting info
  - add number before d - specify min width %3d
  - specify 0-fill %03d
  - specify left justify %-3d
- float/double: %f, %e, %g
  - %f: fixed point notation
  - %e: exponential notation
  - %g: chooses between normal and exponential (drops trailing)
- number before decimal - total width to use
- number after decimal - # places after decimal pt
- use 0 for 0-fill, use - for left justify
- char: %c
- string: %s
  - same with int/float you can add
    - number to specify width
      - to specify left-justify
