

Git - Remote

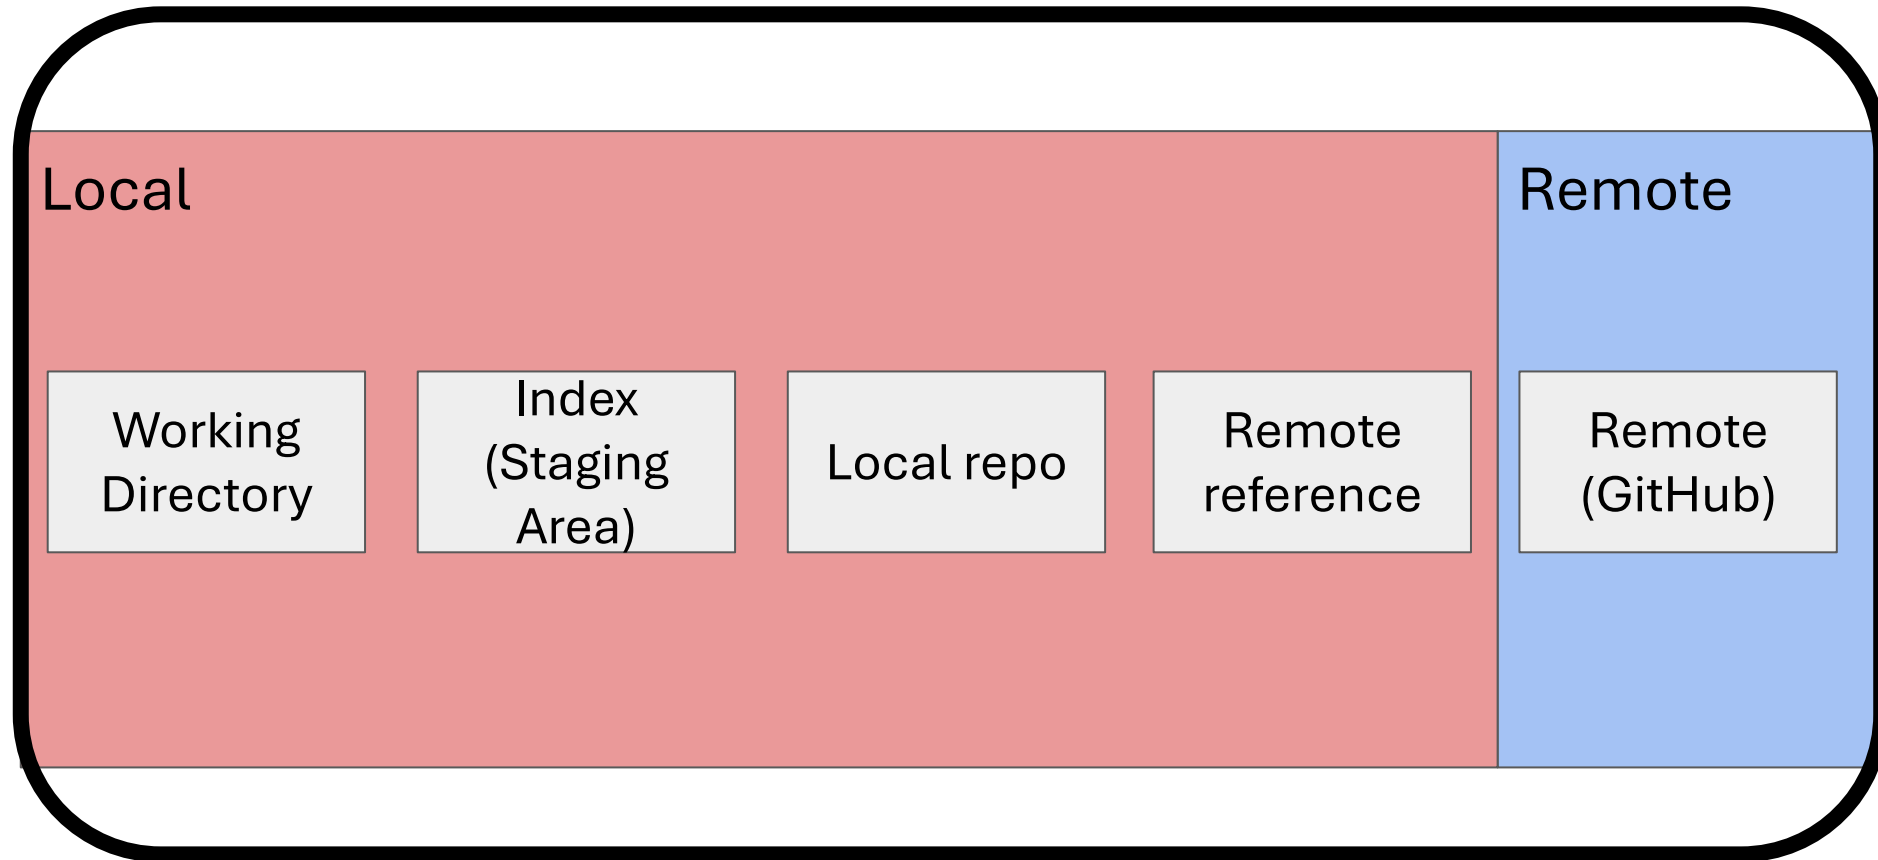

Where are we?

- so far we've only been working locally
- Now we want to connect to a remote
- Remote - a git repo stored elsewhere on a network
- We will use repos stored on GitHub
- Other sites include GitLab and BitBucket

Working Locally

Working Locally + Remotely

Getting Connected

- generally advisable to using SSH keys to interact with GitHub:
<https://docs.github.com/en/authentication/connecting-to-github-with-ssh/adding-a-new-ssh-key-to-your-github-account>

Getting Connected

- If you have a local repo you want to push to GitHub:
 - Create an empty repo on GitHub
 - In your local repo, run:
 - `git remote add origin remote_repo_url`
 - `git push --set-upstream origin main`
- If you do not have a local repo:
 - grab the repo url off GitHub
 - `git clone remote_repo_url`

Workflow

- editing files, staging changes, and commits are the same as when working locally!
- When you want to send your commits remote:
 - git push
 - git push remote branch (if needed)
- When you want to download changes from remote:
 - git fetch
 - git merge
- or
 - git pull

Warning

- Generally bad practice to rewrite history once it has been pushed to a remote
- Generally, don't:
 - rebase
 - reset to an earlier commit
 - commit from detached HEAD
 - Amend a commit that has been pushed
