

Bash Scripting

Variables

- - mynum=5
- - mycolor=hello
- - mylongmsg='hello world'
- Reading/Accessing Value: preceed by \$
 - echo \$mynum
- Spacing is important

Single vs Double Quotes

- single quotes -> everything treated literally
- double quotes -> expand variables inside

Arithmetic Expansion

- can't just do $1 + 1$ or $\text{var1} + \text{var2}$
- $\$(1+1)$
- $\$(\text{num1}+\text{num2}a)$
